

DXC Compliance Data Exchange System

Meeting content regulations

Would you like more control in managing content, lowering costs and running your supply chain? It's all possible with the right compliance data exchange service.

Insights

- Government regulations mandate how you maintain product content information.
- You can access our compliance data exchange as a web-based, fee-paid service.

Gaining control of data

We live in a global world with global customers and global regulations. They require countries and states to maintain product content information — RoHS, WEEE, REACH and HKC — for waste prevention and recycling. Often, reports are required. It takes a large, expensive effort to collect and report on data that is distributed throughout an extensive supply chain.

Efficiently collecting, storing and analyzing this data — while controlling costs — is a major challenge for product manufacturers. Responsibly distributing data throughout the supply chain keeps your risks in meeting international regulatory requirements as low as possible.

Meeting your needs

You need a service that has achieved results for companies like yours. A service that can secure your intellectual property and provide a practical roadmap for deployment. It's important to work with a reliable, knowledgeable partner who has close ties to major enterprise software vendors and knows how to get the job done right — the first time.

Complying with requirements

The DXC Compliance Data Exchange Service can help you efficiently gather, store and report product content for use in compliance and material

reporting to various government agencies worldwide. By using our service, you can:

- Capitalize on your supply chain's knowledge by using established standards, procedures and services
- Become a green corporate citizen while minimizing your reporting costs
- Communicate product content with your suppliers and customers in real time
- Stay ahead of new requirements by analyzing existing product content and planning where changes are needed

Exchanging data

The DXC Compliance Data Exchange Service is centrally operated and supported by our company. It enables standardized creation and exchange of material data sheets or product structures throughout the supply chain, supporting establishment of material management processes. The service consists of a central database, software application and user interface.

It ensures that only valid data forms are the basis of your material data sheets. This service provides data for materials manufactured to a public standard, a service center and training through our partners. Its core is web-based, so no additional software investment is necessary.

You should know that our system is modular. The main functionality and data structures are standardized for all industries, and data can be communicated through all participating supply chains. This enables easy adaptation to specific supply chain requirements regarding:

- Data requirements
- Industry-specific validation and processes
- Industry-specific reporting

Helping in your integration

Working with a network of partners, DXC Technology can help you integrate this service into your existing processes and systems — product data management, product lifecycle management, procurement, and quality and assurance.

We provide support at every step of your implementation, from consulting to systems integration and software development projects.

Delivering real benefits

Our service offers many benefits:

- Requires no hardware or software investment
- Gathers and aggregates data from your suppliers — no need to implement complex processes and systems in-house

- Uses a pay-per-use service structure
- Connects different industries through standardization
- Builds on other industries' experience, providing economies of scale so you can avoid investing in your own solution
- Implements industry-specific data requirements — simple certificate of compliance to 100% disclosure — and reports
- Aggregates information through all supply chain levels in a comprehensive manner while protecting intellectual property
- Uses basic data — substances, substance groups and materials — controlled by an outside organization, which results in valid data only
- Focuses on your link in the supply chain — assembling information related to your product, incorporating components and materials information from suppliers and efficiently collecting information
- Interfaces with your in-house systems
- Uses proven solution and support structure
- Provides global availability and operates 24/7
- Support by our global delivery teams and service centers

- User Interface in several languages (English for data entry)

Understanding the details

This web-based, fee-for-service exchange is built on our experience and knowledge gained from developing the DXC International Material Data System for compliance reporting in the automotive industry. It is adaptable to different industry data requirements and emerging reporting requirements.

The service includes:

- Centralized database and web-based application
- Backup and security
- Help desk
- Substance and material services
- A partner network that provides training and consulting on a fee-for-service basis

An integration project is necessary to connect with your in-house systems and processes.

Project duration depends on the technical complexity of your organization.
